Electrical and Mechanical Motor Data

Electrical Data
The tables below list the current electrical data for all FE Petro submersibles. This data is helpful for determining power requirements, cable sizing, fuse or circuit breaker sizing, and troubleshooting. Mechanical data for all of the pump motor models, as well as footnotes for the entire document, can be found on the next page.

Warning: Highly flammable vapors or liquids may be present in the environment in which this equipment is installed or serviced. Installing or working on this equipment means working in an environment that presents risks of severe injury or death if instructions and standard industry practices are not followed. Follow all applicable codes governing the installation and servicing of this product and the entire system. Always lock out and tag electrical circuit breakers while installing or servicing this equipment and related equipment. Refer to the *Installation and Owner's Manual* of this equipment and related equipment for complete installation and safety information.

Mechanical Data

The table below lists the current mechanical and physical data for all FE Petro Pump Motor Assemblies (PMAs). This information is helpful for troubleshooting or upgrading a system with a larger horsepower PMA. Like STP and PMA model numbers will match in electrical and mechanical characteristics.

Symbol Key

← STP 33, 75, 150 use a 15 – 17.5 μF, 370V capacitor
↑ STP200 uses a 40 - 50 μF, 370V capacitor
→ No capacitor is used with 3 phase pump motor assemblies
↓ STP 75B and 150B use a 15 – 17.5 μF, 440V capacitor
* IST VS2 for use with the IST-VFC or MagVFC controller (no capacitor used)
** IST VS4 for use with the MagVFC controller only (no capacitor used)
*** STP 200B uses a 40 – 50 μF, 440V capacitor
† IST-VFC and MagVFC output is 190V, 70 Hz, 3 ph which is derived from 200-250 V, 50 or 60 Hz, 3 ph input.

Note: Operating pressure is the pressure at the pump manifold when the pump is ON with zero flow "deadhead." This pressure is the maximum pressure the pump can generate at the pump manifold. Higher system pressures though can be generated by a hydraulic hammer when present in a system.

Note: S.F. amps (Service Factor Amps) are defined by the maximum operating amps of the motor.
