Setting Evo™ Series High and High High Alarms Without Calculations

Evo™ Series software allows you to set the High and High High alarms without using tank charts to calculate percentages. You can use this feature through either the Evo™ Series display or the Web interface with an ethernet cable or remote internet connection. The following procedure explains how to use the Web interface.

**Note:** For more information about connecting through the Web, please see the Fuel Management System Programming Guide (part number 000-2173).

2. Choose Volume from the High Product Limit drop-down list, and choose Percentages from the High/Low Product Limits drop-down list.

3. Go to the Tanks section. For each tank at your site, go to the Limits section, and choose a percentage from both the High High Product Volume Limit and High Product Volume Limit drop-down lists.
